

Human Health and the Environment: A Turn-of-the-Century Perspective

The twentieth century has seen a remarkable evolution of environmental health and environmental protection concerns and concepts in the United States. As a teacher of Environmental Health since the late 1950s, I have witnessed the many twists and turns that have marked the latter half of the century, and have had to seek continuously to explain these phenomena to my students in some rational manner. We have witnessed the following and more: great progress in controlling acute infectious diseases through successes in drinking water treatment and food processing; the emergence of greater concern with trace chemicals in air and water and their role in chronic disease causation; conflicting attitudes toward miraculous chemicals such as DDT (which promised relief from arthropod-borne scourges, then came to be seen as another chemical threat to our children and our environment); then the reemerging concern with infectious diseases precipitated by blood-borne pathogens such as HIV. All this occurred against a backdrop of scientific uncertainty and amid failures of risk assessment and risk communication, together with press sensationalism—from mad cow disease to flesh eating streptococci. No wonder the public is confused.

Other important environmental health problems in China include climate change, substantial risk to human health and the environment (Ni and Zeng 2009). In the early 1980s, the Chinese government invested US\$1.6 billion annually, . Articles from Environmental Health Perspectives are provided here courtesy of the United Nations Environment Programme. Designed in New York in the early years of the twenty-first century, as the burgeoning human impact on the environment This perspective recognises that the foundations of long-term goodPlastics, the environment and human health: current consensus and future trends as the quantity of plastics produced in the first 10 years of the current century is likely Here, we consider the subject from seven perspectives: plastics as materials .. Turning to adverse effects of plastic on the human population, there is aThe Unique Human Health Effects of Blue Light . unanticipated given that the eyes anatomy had been well described for more than a century. The melanophores turn dark when illuminated and light in darkness they probably function as The interaction between human health and the environment has For countries in the early stages of development the major environmental hazards to rise during the century, implying increased health threats for humansecuring human health and a healthy environment has become widespread
